

WHAT IS CLAIMED IS:

1. An information handling system, comprising:
a graphical user interface in an operating environment, the graphical user interface configured to provide at least one display including information related to at least one channel wherein the display includes a prompt corresponding with at least one function related to the at least one channel.
2. The information handling system of claim 1 wherein the display includes a on-screen display that combines a graphic element with a broadcast streaming video.
3. The information handling system of claim 2 wherein the banner overlay includes a current banner and a browse banner.
4. The information handling system of claim 1, and further comprising a tuner operably coupled to the graphical user interface, wherein the tuner is tunable to a plurality of channels including the at least one channel.
5. The information handling system of claim 4 wherein the plurality of channels includes at least one event.
6. The information handling system of claim 1, and further comprising a convergence system operably coupled thereto.
7. A medium having executable instructions stored thereon for execution on a suitably equipped electronic system, the instructions for causing the electronic system to perform a method, the method comprising the steps of:

generating a display, wherein the display includes information related to at least one channel;

prompting, with the display, a function related to the at least one channel.

8. The medium of claim 7 wherein the suitably equipped electronic system includes a convergence system.

9. The medium of claim 7, wherein the step of generating a display includes the step of generating a banner overlay.

10. The medium of claim 9, wherein the step of generating a banner overlay includes the steps of generating a current event banner and generating a browse banner.

11. The medium of claim 7 wherein the electronic system receives a plurality of channels.

12. The medium of claim 11 wherein the plurality of channels includes an event.

13. A system, comprising:

means for generating a display, the display including information related to at least one channel; and

means for providing at least one prompt in the display, the prompt corresponding with at least one function related to the at least one channel.

14. The system of claim 13, and further comprising means for selecting the at least one channel from a plurality of available channels wherein the available channels include events.

15. The system of claim 13, and further comprising means for receiving the information related to the at least one channel.

16. The system of claim 13, and further comprising means for performing the function related to the at least one channel.

17. A method for use with an information handling system, the method comprising the steps of:

generating a display including information related to at least one channel
wherein the display includes at least one prompt; and
receiving a command in response to the prompt wherein the command corresponds with at least one function related to the at least one channel.

18. The method of claim 17, and further comprising the steps of:

generating a video output; and
selecting one of a current event mode wherein the video output corresponds with the at least one channel, and a browse mode wherein the video output does not correspond with the at least one channel.

19. The method of claim 18 wherein the step of generating a display includes the step of generating an overlay having a current event banner and a browse banner.

20. The method of claim 18, and further comprising the step of receiving a plurality of channels, wherein the plurality of channels includes at least one event.
